

SUMMARY

In this session we learn about the concrete in terms of the components that go into concrete making. It is stressed enough that concrete is an important part of the building industry in the current world scenario; hence the raw components that go into its making, their sources, their properties and quality are discussed. Each component is also studied in terms of their various types, testing of their quality etc. so fine aggregates, coarse aggregates and water which are the most significant components of what make concrete in terms of sources of materials are discussed, with respect to their properties and classification of availability.
