

SUMMARY

In this session we learn about the biggest structures, tallest structures, structures in all possible shapes, structures spanning rivers, structures over hills and mountains. There was one monster yet to cover. Envisage a giant project in the sea as reclaimed land. Kansai International airport was a first in many aspects. Its efficiency and the mathematical genius can be surpassed only by itself.

Sitting on a highly active tectonic zone prone to frequent and violent earthquakes and tsunamis, this project has survived all odds and is definitely one structure which an architect should know about and study.
