Paper No. and Title : (401) Test, Measurement and Evaluation in Physical Education

Unit-3: Measures of Central Tendency

Summary:

Mean, median and mode are single representative values to tell about extent of central tendency of the data sets. The median is also called a positional value because it divides whole set of ordered data into two equal parts. Like median, other positional measures are quartiles, deciles and percentiles. The quartiles are particularly useful in calculation of measures of dispersion, more specifically, in calculation of quartile deviation. These partition values are considered in a separate unit titled “Measures of desperation”.
