

1. Introduction

Welcome to the series of E-learning modules on measures and related results of multiple and partial correlation and regression in three variables. Here we have discussed different results related to multiple and partial correlation coefficients.

By the end of this session, you will be able to:

- Explain the related measures and results of multiple and partial correlation coefficients

In previous modules, we have studied about Partial and multiple correlation and regression. Now, let us discuss about some of measures and related results of the multiple and partial correlation coefficient.

Show that the correlation coefficient between the residuals $(X_1 \text{ point } 2, 3)$ and $(X_2 \text{ point } 1, 3)$ is equal and opposite to that between $(X_1 \text{ point } 3)$ and $(X_2 \text{ point } 3)$.

We prove this result as follows.

The correlation coefficient between $(X_1 \text{ point } 2, 3)$ and $(X_2 \text{ point } 1, 3)$ is given by,
(Covariance of $X_1 \text{ point } 2, 3$) and $(X_2 \text{ point } 1, 3)$ divided by $(\sigma_1 \text{ point } 2, 3)$ into $(\sigma_2 \text{ point } 1, 3)$

Is equal to $(\sum X_1 \text{ point } 2, 3) \text{ into } (X_2 \text{ point } 1, 3) \text{ divided by } (N \text{ into } \sigma_1 \text{ point } 2, 3) \text{ into } (\sigma_2 \text{ point } 1, 3)$

Is equal to $(1 \text{ by } N) \text{ into } (\sum X_2 \text{ point } 1, 3) \text{ into } (X_1 \text{ minus } b_{1, 2 \text{ point } 3}) \text{ into } (X_2 \text{ minus } b_{1, 3 \text{ point } 2}) \text{ into } (X_3) \text{ divided by } (\sigma_1 \text{ point } 2, 3) \text{ into } (\sigma_2 \text{ point } 1, 3)$.

Is equal to $(\text{minus } b_{1, 2 \text{ point } 3}) \text{ into } (\sum X_2 \text{ point } 1, 3) \text{ into } (X_2) \text{ divided by } (N \text{ into } \sigma_1 \text{ point } 2, 3) \text{ into } (\sigma_2 \text{ point } 1, 3)$

Is equal to $(\text{minus } b_{1, 2 \text{ point } 3}) \text{ into } (\sum X_2 \text{ point } 1, 3 \text{ square}) \text{ divided by } (N \text{ into } \sigma_1 \text{ point } 2, 3) \text{ into } (\sigma_2 \text{ point } 1, 3)$

Is equal to $(\text{minus } b_{1, 2 \text{ point } 3}) \text{ into } (\sigma_2 \text{ point } 1, 3) \text{ divided by } (\sigma_1 \text{ point } 2, 3)$ is equal to $(\text{minus } b_{1, 2 \text{ point } 3}) \text{ into } (\sigma_2) \text{ into } (\text{square root of } \omega) \text{ by } (\omega_2, 2) \text{ divided by } (\sigma_1) \text{ into } (\text{square root of } \omega) \text{ by } (\omega_1, 1)$.

Where ω is equal to determinant of $(1) (r_{1, 2}) (r_{1, 3}) (r_{2, 1}) (1) (r_{2, 3}) (r_{3, 1}) (r_{3, 2}) (1)$.

$(\omega_1, 1)$ is equal to determinant of $(1) (r_{2, 3}) (r_{3, 2}) (1)$ is equal to $(1 \text{ minus } r_{2, 3} \text{ square})$ and

$(\omega_2, 2)$ is equal to determinant of $(1) (r_{1, 3}) (r_{3, 1}) (1)$ is equal to $(1 \text{ minus } r_{3, 1} \text{ square})$.

Therefore, correlation coefficient between $(X_1 \text{ point } 2, 3)$ and $(X_2 \text{ point } 1, 3)$ is equal to $(\text{minus } b_{1, 2 \text{ point } 3}) \text{ into } (\sigma_2) \text{ by } (\sigma_1) \text{ into } (\text{square root of } 1 \text{ minus } r_{2, 3} \text{ square}) \text{ divided by } (1 \text{ minus } r_{1, 3} \text{ square})$ is equal to $(\text{minus } b_{1, 2 \text{ point } 3}) \text{ into } (\sigma_2 \text{ point } 3) \text{ divided by } (\sigma_1 \text{ point } 3)$.

(Since $\sigma_2 \text{ point } 3 \text{ square}$ is equal to $\sigma_2 \text{ square into } 1 \text{ minus } r_{2, 3} \text{ square}$ and $\sigma_1 \text{ point } 3 \text{ square}$ is equal to $\sigma_1 \text{ square into } 1 \text{ minus } r_{1, 3} \text{ square}$.)

Hence, the coefficient of correlation, $(r \text{ of } X_1 \text{ point } 2, 3) \text{ and } (X_2 \text{ point } 1, 3)$ is equal to $(\text{minus covariance of } X_1 \text{ point } 3), (X_2 \text{ point } 3) \text{ divided by } (\sigma_2 \text{ point } 3 \text{ square}) \text{ into } (\sigma_2 \text{ point } 3) \text{ divided by } (\sigma_1 \text{ point } 3)$

Is equal to (minus covariance of X_1 point 3), $(X_2$ point 3) divided by $(\sigma^2$ point 3) into $(\sigma^2$ point 3) is equal to (minus r X_1 point 3), $(X_2$ point 3).
Hence the result.

2. Result 2

Show that if X_3 is equal to a into X_1 plus b into X_2 , the three partial correlations are numerically equal to unity, $(r_{1,3} \text{ point } 2)$ having the sign of $(a, r_{2,3} \text{ point } 1)$, the sign of $(b$ and $r_{1,2} \text{ point } 3)$, the opposite sign of $(a$ by $b)$.

Proof of this result is as follows.

Here, we may regard X_3 as dependent on X_1 and X_2 which may be taken as independent variables. Since X_1 and X_2 are independent, they are uncorrelated.

Thus, (r_{X_1, X_2}) is equal to zero implies, covariance of (X_1, X_2) is equal to zero).

Variance of X_3 is equal to Variance of $(a$ into $X_1)$ plus $(b$ into $X_2)$ is equal to (a^2) into variance of X_1 plus (b^2) into variance of X_2 plus $(2$ into a into b into covariance of $X_1, X_2)$

Is equal to (a^2) into (σ_1^2) plus (b^2) into (σ_2^2) .

Where, variance of X_1 is equal to (σ_1^2) and variance of X_2 is equal to (σ_2^2) . Also, $(X_1$ into $X_3)$ is equal to $(X_1$ into a into x_1 plus b into $X_2)$

Is equal to (a) into (X_1^2) plus (b) into (x_1) into (X_2) .

Assuming that X_i 's are measured from their means, on taking expectations of both sides, we get,

$(\text{Covariance of } X_1, X_3)$ is equal to $(a$ into $\sigma_1^2)$ plus $(b$ into covariance of $X_1, X_2)$ is equal to $(a$ into $\sigma_1^2)$ Therefore, $(r_{1,3})$ is equal to $(\text{covariance of } X_1, X_3)$ divided by square root of variance of X_1 into variance of X_3 is equal to $(a$ into $\sigma_1^2)$ divided by square root of (σ_1^2) into (a^2) into (σ_1^2) plus (b^2) into (σ_2^2) is equal to $(a$ into $\sigma_1)$ divided by k .

Where (k^2) is equal to (a^2) into (σ_1^2) plus (b^2) into (σ_2^2) .

Similarly we will get, $(r_{2,3})$ is equal to $(\text{covariance of } X_2, X_3)$ divided by $(\text{variance of } X_2)$ into $(\text{variance of } X_3)$

Is equal to (b) into (σ_2^2) divided by square root of (σ_2^2) into (a^2) into (σ_1^2) plus (b^2) into (σ_2^2) .

Is equal to (b) into (σ_2) divided by (K) .

Hence, $(r_{1,3} \text{ point } 2)$ is equal to $(r_{1,3} \text{ minus } r_{1,2})$ into $(r_{3,2})$ divided by square root of $(1 \text{ minus } r_{1,2}^2)$ into $(1 \text{ minus } r_{3,2}^2)$ is equal to (a) into (σ_1) divided by (k) into (k) divided by $(\text{square root of } d^2)$ minus (b^2) into (σ_2^2) is equal to (a) into (σ_1) divided by $(\text{square root of } a^2)$ into (σ_1^2) is equal to (a) into (σ_1) divided by modulus of (a) into (σ_1) is equal to $(\text{plus or minus } 1)$, according as a is positive or negative. Hence $r_{1,3} \text{ point } 2$ has the same sign as a .

Again,

$(r_{2,3} \text{ point } 1)$ is equal to $(r_{2,3} \text{ minus } r_{2,1})$ into $(r_{3,1})$ divided by square root of $(1 \text{ minus } r_{2,1}^2)$ into $(1 \text{ minus } r_{3,1}^2)$.

is equal to b into σ_2 divided by k into k by square root of k^2 minus a^2 into σ_1^2

is equal to b into σ_2 divided by square root b^2 into σ_2^2

is equal to b into σ_2 divided by modulus of b into σ_2

is equal to (plus or minus 1)

According as (b is positive or negative). Hence, (r2, 3 point 1) has the same sign as b.

(Now r1, 2 point 3) is equal to (r1, 2 minus r1), (3 into r2, 3) divided by square root of (1 minus r1, 3 square) into (1 minus r2, 3 square) is equal to (minus a) into (sigma 1) by (k) into (b) into (sigma 2) by (k) into (k square) divided by square root of (k square minus a square) into (sigma 1 square) into (k square minus b square) into (sigma 2 square)

is equal to (minus a) into (b) into (sigma 1) into (sigma 2) divided by square root of (a square) into (sigma 1 square) into (b square) into (sigma 2 square).

is equal to (minus a) into (b) divided by square root of (a square) into (b square).

Which can be written as,

(Minus a) by (b) divided by square root of (a square) by (b square)

Is equal to (minus a) by (b) divided by modulus of (a by b)

Is equal to (minus or plus 1) according as (a by b) is positive or negative. Hence, (r1, 2 point 3) has the sign opposite to that of (a by b).

3. Result 3

If $(r_1, 2)$ and $(r_1, 3)$ are given, show that $(r_2, 3)$ must lie in the range

$(r_1, 2) \text{ into } (r_1, 3) \text{ plus or minus } (1 \text{ minus } (r_1, 2 \text{ square}) \text{ minus } (r_1, 3 \text{ square}) \text{ plus } (r_1, 2 \text{ square}) \text{ into } (r_1, 3 \text{ square power half}))$.

If $(r_1, 2)$ is equal to (k) , and $(r_1, 3)$ is equal to $(\text{minus } k)$, show that $(r_2, 3)$ will lie between $(\text{minus } 1 \text{ and } 1 \text{ minus } 2) \text{ into } (k \text{ square})$.

To prove this result let us consider $(r_1, 2 \text{ point } 3 \text{ square})$.

That is, $(r_1, 2 \text{ point } 3 \text{ square})$ is equal to $(r_1, 2) \text{ minus } (r_1, 3) \text{ into } (r_2, 3) \text{ divided by square root of } (1 \text{ minus } r_1, 3 \text{ square}) \text{ into } (1 \text{ minus } r_2, 3 \text{ square})$, the whole square is less than or equal to 1.

Therefore, $(r_1, 2) \text{ minus } (r_1, 3) \text{ into } (r_2, 3) \text{ whole square is less than or equal to } (1 \text{ minus } r_1, 3 \text{ square}) \text{ into } (1 \text{ minus } r_2, 3 \text{ square})$.

Implies, $(r_1, 2 \text{ square}) \text{ plus } (r_1, 3 \text{ square}) \text{ into } (r_2, 3 \text{ square}) \text{ minus } (2) \text{ into } (r_1, 2 \text{ into } (r_1, 3) \text{ into } (r_2, 3))$ is less than or equal to $1 \text{ minus } (r_1, 3 \text{ square}) \text{ minus } (r_2, 3 \text{ square}) \text{ plus } (r_1, 3 \text{ square}) \text{ into } (r_2, 3 \text{ square})$

Implies, $(r_1, 2 \text{ square}) \text{ plus } (r_1, 3 \text{ square}) \text{ plus } (r_2, 3 \text{ square}) \text{ minus } (2) \text{ into } (r_1, 2) \text{ into } (r_1, 3) \text{ into } (r_2, 3)$ is less than or equal to 1.

This condition holds for consistent values of $(r_1, 2)$ $(r_1, 3)$ and $(r_2, 3)$. And hence, the above inequality can be rewritten as,

$(r_2, 3 \text{ square}) \text{ minus } (2) \text{ into } (r_1, 2) \text{ into } (r_1, 3) \text{ into } (r_2, 3) \text{ plus } (r_1, 2 \text{ square}) \text{ plus } (r_1, 3 \text{ square}) \text{ minus } (1)$ is less than or equal to zero

Hence, for given values of $(r_1, 2)$ and $(r_1, 3)$ $(r_2, 3)$ must lie between the roots of the quadratic (in $r_2, 3$) equation,

$(r_2, 3 \text{ square}) \text{ minus } (2) \text{ into } (r_1, 2) \text{ into } (r_1, 3) \text{ into } (r_2, 3) \text{ plus } (r_1, 2 \text{ square}) \text{ plus } (r_1, 3 \text{ square}) \text{ minus } (1)$ is equal to zero.

Which are given by, $(r_2, 3)$ is equal to $(r_1, 2) \text{ into } (r_1, 3) \text{ plus or minus square root of } (r_1, 2 \text{ square}) \text{ into } (r_1, 3 \text{ square}) \text{ minus } (r_1, 2 \text{ square}) \text{ plus } (r_1, 3 \text{ square}) \text{ minus } 1$.

Hence $(r_1, 2) \text{ into } (r_1, 3) \text{ minus square root of } (1 \text{ minus } (r_1, 2 \text{ square}) \text{ minus } (r_1, 3 \text{ square}) \text{ plus } (r_1, 2 \text{ square}) \text{ into } (r_1, 3 \text{ square}))$ is less than or equal to $r_2, 3$ is less than or equal to $(r_1, 2) \text{ into } (r_1, 3) \text{ plus square root of } (1 \text{ minus } (r_1, 2 \text{ square}) \text{ minus } (r_1, 3 \text{ square}) \text{ plus } (r_1, 2 \text{ square}) \text{ into } (r_1, 3 \text{ square}))$, name it as equation star.

In other words, $(r_2, 3)$ must lie in the range, $(r_1, 2) \text{ into } (r_1, 3) \text{ plus or minus square root of } (1 \text{ minus } (r_1, 2 \text{ square}) \text{ minus } (r_1, 3 \text{ square}) \text{ plus } (r_1, 2 \text{ square}) \text{ into } (r_1, 3 \text{ square}))$.

In particular, if $(r_1, 2)$ is equal to (k) and $(r_1, 3)$ is equal to $(\text{minus } k)$, we get from star, $(\text{Minus } k \text{ square}) \text{ minus square root of } (1 \text{ minus } (k \text{ square}) \text{ minus } (k \text{ square}) \text{ plus } (k \text{ power } 4))$ is less than or equal to $r_2, 3$ is less than or equal to $(\text{minus } k \text{ square}) \text{ plus square root of } (1 \text{ minus } (k \text{ square}) \text{ minus } (k \text{ square}) \text{ plus } (k \text{ power } 4))$.

Implies, $(\text{minus } k \text{ square}) \text{ (minus } 1) \text{ (minus } k \text{ square})$ is less than or equal to $r_2, 3$ is less than or equal to $(\text{minus } (k \text{ square}) \text{ plus } (1) \text{ minus } (k \text{ square}))$.

Therefore, $(\text{minus } 1) \text{ less than or equal to } (r_2, 3) \text{ less than or equal to } (1 \text{ minus } 2 \text{ into } (k \text{ square}))$.

4. Result 4

Prove that $(b_1, 2 \text{ point } 3) \text{ into } (b_2, 3 \text{ point } 1) \text{ into } (b_3, 1 \text{ point } 2)$ is equal to $(r_1, 2 \text{ point } 3) \text{ into } (r_2, 3 \text{ point } 1) \text{ into } (r_3, 1 \text{ point } 2)$.

To prove the above results, let us consider the expressions of b in terms of r and σ .

That is, $(b_1, 2 \text{ point } 3)$ is equal to $(r_1, 2 \text{ point } 3) \text{ into } (\sigma_1, 1 \text{ point } 3) \text{ divided by } (\sigma_2, 2 \text{ point } 3)$

$(b_2, 3 \text{ point } 1)$ is equal to $(r_2, 3 \text{ point } 1) \text{ into } (\sigma_2, 2 \text{ point } 1) \text{ divided by } (\sigma_3, 3 \text{ point } 1)$, and

$(b_3, 1 \text{ point } 2)$ is equal to $(r_3, 1 \text{ point } 2) \text{ into } (\sigma_3, 3 \text{ point } 2) \text{ divided by } (\sigma_1, 1 \text{ point } 2)$.

Now let us consider the left hand side of given expression and substitute for b 's we get,

$(b_1, 2, \text{ point } 3) \text{ into } (b_2, 3 \text{ point } 1) \text{ into } (b_3, 1 \text{ point } 2)$ is equal to $(r_1, 2 \text{ point } 3) \text{ into } (\sigma_1, 1 \text{ point } 3) \text{ into } (\sigma_2, 2 \text{ point } 3), \text{ into } (r_2, 3 \text{ point } 1) \text{ into } (\sigma_2, 2 \text{ point } 1) \text{ divided by } (\sigma_3, 3 \text{ point } 1), \text{ into } (r_3, 1 \text{ point } 2) \text{ into } (\sigma_3, 3 \text{ point } 2) \text{ divided by } (\sigma_1, 1 \text{ point } 2)$.

On simplification we get,

$(r_1, 2 \text{ point } 3) \text{ into } (r_2, 3 \text{ point } 1) \text{ into } (r_3, 1 \text{ point } 2)$.

Hence the proof.

5. Result 5

If $(r_1, 2)$ is equal to $(r_2, 3)$ is equal to $(r_3, 1)$ is equal to row, which is not equal to one, then $(r_1, 2 \text{ point } 3)$ is equal to $(r_2, 3 \text{ point } 1)$ is equal to $(r_3, 1 \text{ point } 2)$ is equal to (row) divided by (1 plus row) . And $(R_1 \text{ point } 2, 3)$ is equal to $(R_2 \text{ point } 1, 3)$ is equal to $(R_3 \text{ point } 1, 2)$ is equal to (row) into (square root of 2) divided by (square root of 1) plus (row).

Proof:

We know that $(r_1, 2 \text{ point } 3)$ is equal to $(r_1, 2)$ minus $(r_1, 3)$ into $(r_2, 3)$ divided by (square root of 1) minus $(r_1, 3 \text{ square})$ into $(1 \text{ minus } r_2, 3 \text{ square})$.

Substituting $(r_1, 2)$ is equal to $(r_1, 3)$ is equal to $(r_2, 3)$ is equal to (row), we get,

$(r_1, 2 \text{ point } 3)$ is equal to (row) minus (row square) divided by (square root of 1) minus (row square) into $(1 \text{ minus row square})$.

Is equal to (row) into (1 minus row) divided by $(1 \text{ minus row square})$

is equal to (row) divided by (1 plus row) .

Similarly, $r_2, 3 \text{ point } 1$ is equal to $r_2, 3$ minus $r_2, 1$ into $r_3, 1$ divided by square root of $1 \text{ minus } r_2, 1 \text{ square}$ into $1 \text{ minus } r_3, 1 \text{ square}$

is equal to row minus row square divided by square root of $1 \text{ minus row square}$ into $1 \text{ minus row square}$

is equal to row by 1 plus row .

Finally row $3, 1 \text{ point } 2$ is equal to $r_3, 1$ minus $r_3, 2$ into $r_1, 2$ divided by Square root minus $r_3, 2 \text{ square}$ into $1 \text{ minus } r_1, 2 \text{ square}$

is equal to row minus row square divided by square root of $1 \text{ minus row square}$ into $1 \text{ minus row square}$

is equal to row by 1 plus row .

Observe from above three expressions that,

$r_1, 2 \text{ point } 3$ is equal to $r_2, 3 \text{ point } 1$ is equal to $r_3, 1 \text{ point } 2$ is equal to row divided by 1 plus row .

Now let us consider the multiple correlation coefficient.

$R_1 \text{ point } 2, 3 \text{ square}$ is equal to $r_1, 2 \text{ square}$ plus $r_1, 3 \text{ square}$ minus 2 into $r_1, 2$ into $r_1, 3$ into $r_2, 3$ divided by $1 \text{ minus } r_2, 3 \text{ square}$.

On substitution, we get,

$R_1 \text{ point } 2, 3 \text{ square}$ is equal to row square plus row square minus 2 into row cube divided by $1 \text{ minus row square}$

Is equal to 2 into row square into 1 minus row divided by 1 plus row into 1 minus row is equal to 2 into row square divided by 1 plus row .

Similarly consider

$R_2 \text{ point } 1, 3 \text{ square}$ is equal to $r_2, 1 \text{ square}$ plus $r_2, 3 \text{ square}$ minus 2 into $r_2, 1$ into $r_2, 3$ into $r_1, 3$ divided by $1 \text{ minus } r_1, 3 \text{ square}$

Is equal to row square plus row square minus 2 into row cube divided by $1 \text{ minus row square}$

Is equal to 2 into row square divided by 1 plus row .

And finally $R_3 \text{ point } 1, 2 \text{ square}$ is equal to $r_3, 1 \text{ square}$ plus $r_3, 2 \text{ square}$ minus 2 into $r_3, 1$ into $r_3, 2$ into $r_1, 2$ divided by $1 \text{ minus } r_1, 2 \text{ square}$

Is equal to row square plus row square minus 2 into row cube divided by $1 \text{ minus row square}$

Is equal to 2 into row square divided by 1 plus row .

Observe that we got,

$R_1 \text{ point } 2, 3^2 \text{ is equal to } R_2 \text{ point } 1, 3^2 \text{ is equal to } R_3 \text{ point } 1, 2 \text{ is equal to } 2 \text{ into row square divided by } 1 \text{ plus row.}$

By taking square root, we get,

$R_1 \text{ point } 2, 3 \text{ is equal to } R_2 \text{ point } 1, 3 \text{ is equal to } R_3 \text{ point } 1, 2 \text{ is equal to row into square root of } 2 \text{ divided by square root of } 1 \text{ plus row.}$

Hence the result.

Here's a summary of our learning in this session:

- Related results of multiple and partial correlation and regression
